
one configuration throughout: $\sigma_{\text{scatt}} = 10^{-4}$, $\sigma_{\text{res}} = 0$, no hit drop, $\varphi_{\max} = 0.2$, FIXED $\varepsilon = 2$ mrad, $\gamma = 3$, $\delta = 1$, step kernel · campaign mean±sem over reps (classical 5–20, line comb 5–10, 1BQF 3–10 per T) · $\tau = 0.35$ = attractor $\delta/(\gamma+\delta)$ + 0.10 applied to every solver; 1BQF activations rescaled to the classical signal-support norm (campaign convention) · a measured 0% false rate is drawn at the 10^{-3} floor · no fitted-response series: the fitted polynomial has no absolute scale and is read only at a matched working point (companion figure)
