(a) a true track: 5 hits, 4 segments
its graph is the chain P_4
1
2
3
4
(b) $\lambda = 2.382$ — BRIGHT
$\langle v, \mathbf{b} \rangle = 1.946$
mode weight
segment along the track
(c) $\lambda = 3.382$ — dark
$\langle v, \mathbf{b} \rangle = 0.000$
antisymmetric under the chain's reflection:
the uniform bias cannot excite it
(d) $\lambda = 4.618$ — BRIGHT
$\langle v, \mathbf{b} \rangle = 0.460$
(e) $\lambda = 5.618$ — dark
$\langle v, \mathbf{b} \rangle = 0.000$
(f) the solution is the two bright modes,
and nothing else
activation
sum = 4/11, 5/11, 5/11, 4/11
$\lambda = 2.382$ (98.5% of the weight)
$\lambda = 4.618$ (1.5%)
