

Same rule, three clusters: dots = hits (colour = track), green=true segment, red dashed=false segment

(A) isolated FALSE segment

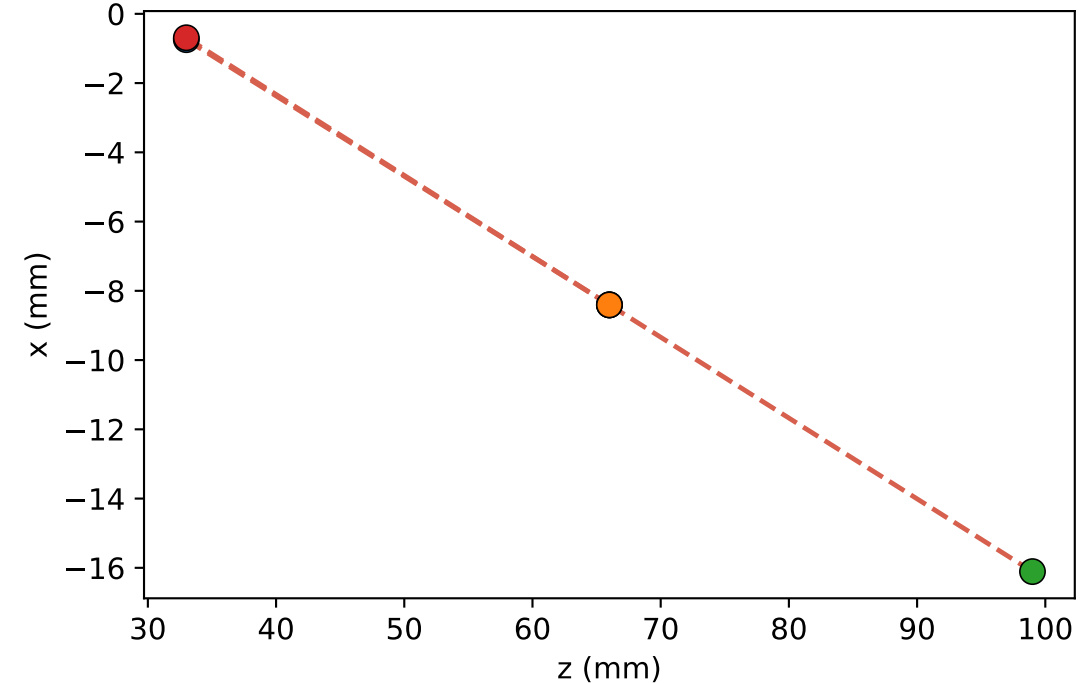

1 cluster, no neighbours -> eigenvalue $\lambda=4$ (NOTCH/bad)
classical $x=0.25$, quantum $x\sim 0$ -> correctly ERASED

(B) a REAL track (4-segment chain)

eigenvalues [2.38 3.38 4.62 5.62] (all off-notch = GOOD)
quantum keeps 3/4 (one outer drops to 0.18) -> track survives

(C) cross-track BRIDGE (false)

eigenvalues [2.59 4. 5.41] (2 good + 1 on notch)
hits from [13, 116, 133, 296] -> FALSE POSITIVE survives
