(a) width
one-bit filter (2 calls)
QSVT, phase sequence (160 calls)
QSVT, Chebyshev walk (63 calls)
HHL, eight bits (510 calls)
logical qubits
tracks per event T
(b) gates per event, amplification included
controlled evolution, measured transpilation
controlled evolution, extrapolated $\propto T^{1.37}$
hit-priced block encoding, model $\propto T^{0.85}$
HHL, structure-level estimate
two-qubit gates per solved event
tracks per event T
