

Eigenvalue trajectories $\lambda(\beta)$, comb lines $\pm hw$ shaded — what the ε -fork can and cannot move

**contaminated cluster (true track + parasite):
recovery — true modes migrate into the bands
(5 segments; green = true-weighted mode, red = false-weighted)**

**isolated floor bridge, no fork partner within ε :
 β -invariant — the residual floor
(4 segments; green = true-weighted mode, red = false-weighted)**
