

(a) §7q amplitude spectrum — quantum solution is quantised; false leakage forms a discrete high-amplitude band, not near-zero noise (E1 statevector, T=1000)

(b) per-segment leakage probability $p_{\text{leak}} = N_{\text{false act}}/N_{\text{false all}}$
(factors out the combinatorial false pool)

(c) threshold-free separability
(1 = a perfect cut exists; <1 = irreducible overlap)
