The marginal value of one more degree step (QSVT, coefficients refit at every degree, $T = 200$)
(a) moderate noise
(b) heavy noise
marginal efficiency gain per degree step
Δ eff @ far ≤ 1%
occupancy onset $d = 4 \to 8$: +0.94 (off scale)
QSVT, base A
QSVT, A + occupancy $\alpha = 0.05$
QSVT, A + bifurcation $\beta = 0.5$
QSVT, A + occupancy + bifurcation
polynomial degree d
polynomial degree d
moderate + heavy noise as in the degree scan · marginal gain between CONSECUTIVE degrees of the (non-uniformly spaced) scan grid {4, 8, ..., 48, 56, 64, 80, 84, 96, 120, 160} · median of 10 reps
